

Please compensate for your carbon footprint and help Africa to develop itself!

With every Euro, dollar or pound you donate, one tree will be planted, carbon dioxide will be absorbed from the atmosphere and the whole world will benefit. Please be generous!

Tree planting in schools

Most Discover partners work closely with schools. Teachers, children and pupils are enthusiastic about planting trees. They enjoy seeing them grow. Then they provide shade and they enjoy the fruits.

Then many parents get involved as well!

Planting trees make peace!

A shea butter tree, a symbol of peace in northwest Uganda.

Trees planted along boundaries reduce conflicts over land. By providing food and firewood, Agroforestry reduces stress levels in the household.

In Nyara, in northwest Uganda, Discover colleague Christopher Nyakuni has worked hard to bring peace to two clans that, for many years, suffered terrible conflict. Now, to cement their peace, the clans will plant 800 shea butter trees, and work together to stop others from cutting mature shea butter trees for charcoal.

Trees prevent landslides

Robert Bwambale coordinates a Discover Group with 65 members in Maliba,

under the Rwenzori Mountains in Uganda. In the first half of this year, farmers in Maliba planted over 2000 trees. By practising agroforestry, they can grow fruit and vegetables even during periods of severe drought, and by planting trees on the mountain slopes, they stabilise the soils so that even torrential rains do not result in landslips.

Now Robert will train 100 farmers and community leaders in the wider district in managing the impacts of climate change by planting trees.

Pupils at Wandengeya Primary School in Uganda. Supported by Discover colleagues in Africa, schoolchildren are planting thousands of trees.

Without trees on the mountain slopes, dreadful, and even fatal, landslips occur.
